SUMMARY

Backend-leaning Node.js developer with ~1 year of experience designing and building APIs, data models, and server-side systems. Comfortable working with concurrency concerns, background job processing, and real-time infrastructure. Currently building a production-grade influencer marketplace solo — Node.js multi-service backend with Redis slot locking, Meilisearch, Socket.io, BullMQ async workers, Stripe payments, and a multi-role JWT auth system. I think carefully about data consistency, edge cases, and how services interact. I can build the frontend when needed, but backend systems are where I go deepest.

TECHNICAL SKILLS

Languages	TypeScript, JavaScript (ES6+)
Runtime & Framework	Node.js, Express.js 5, REST API Design, Middleware architecture
Databases	MongoDB / Mongoose, Schema design, Query optimisation, Indexing
Caching & Locking	Redis (caching · TTL · slot locking · atomic operations)
Async & Queues	BullMQ, RabbitMQ, Background job processing, Event-driven patterns
Real-time	Socket.io (WebSocket rooms, event broadcasting, live state sync)
Search	Meilisearch (index config · faceted filtering · custom ranking)
Auth & Security	JWT (access + refresh tokens), RBAC, OTP via Nodemailer, Middleware guards
Storage & Payments	AWS S3 (file uploads), Stripe, Razorpay
Tools	Git / GitHub, Postman, ESLint / Prettier, Husky
Frontend (working knowledge)	React.js, Next.js (App Router), Tailwind CSS

EXPERIENCE

Full Stack Developer Intern

2024 – 2025

Web Development Firm — India

- Designed and built RESTful APIs across 3+ MERN projects — JWT auth, middleware-level request validation, modular service architecture, and centralised error handling.
- Implemented auth flows, order management pipelines, inventory systems, and role-based access control across multiple client applications.
- Worked on MongoDB schema design and query optimisation; structured data models to handle edge cases reliably across different application domains.
- Collaborated in Agile sprints with peer code reviews; delivered backend features consistently on schedule.

PROJECTS

Noillin — Influencer–Business Marketplace [In Progress]

Node.js · Express · MongoDB · Redis · Socket.io · Meilisearch · BullMQ · RabbitMQ · AWS S3 · Stripe · TypeScript · Next.js (frontend)

- Designing and building the full backend of a production-grade influencer marketplace solo — multi-service Node.js architecture with clear separation between the core API, real-time server, and async worker.
- Engineered a slot generation engine: processes influencer availability rules (working days, custom time slots, date overrides) into a real-time slot suggestion feed consumed by the booking flow.
- Implemented Redis-based slot locking to prevent double-bookings under concurrent requests — atomic lock creation on slot selection, TTL-based expiry if payment does not complete, lock release on success or cancellation.

- Designed the complete booking state machine: influencer selection → slot suggestion → Redis lock → booking record creation → payment initiation → confirmation — with consistent error handling and rollback logic at each transition.
- Integrated Meilisearch for influencer discovery: configured index settings, faceted filters (category, platform, follower count, price, location), and custom ranking rules for relevance tuning.
- Built a Socket.io real-time layer for live booking status propagation (pending → locked → confirmed) — scoped to per-booking rooms to avoid unnecessary broadcast overhead.
- Set up BullMQ and RabbitMQ for async background jobs — email notifications, post-booking processing, and tasks that should not block the request cycle.
- Designed a multi-role JWT auth system (user / influencer / admin): access + refresh token rotation, OTP email verification via Nodemailer, interceptor middleware, and route-level RBAC guards.
- Structured backend into service-based modules (User, Influencer, Availability, Booking, Search, Admin) — domain-driven routing with schema-level input validation (Zod/Joi) throughout.
- Integrated Stripe for payment initiation and webhook handling; AWS S3 for influencer profile media uploads.

Be-Yours — E-Commerce Platform [\[Live\]](#)

Node.js · Express · MongoDB · JWT · Azure · React.js (frontend) · Vercel

- Designed and built the full backend: RESTful APIs for product management, cart, order placement, and user auth — all with JWT-protected routes.
- Modelled MongoDB schemas for users, products, and orders; handled server-side logic for inventory state and order lifecycle.
- Deployed backend on Azure; integrated with a React frontend on Vercel.

Abito — Habit Tracker

Node.js · Next.js API Routes · MongoDB Atlas · TypeScript · Vercel

- Built backend API routes and MongoDB Atlas data layer for a habit tracking app — CRUD operations with data consistency and clean error handling.
- Used as a practice project for TypeScript-strict backend patterns and Next.js API routes.

EDUCATION

Bachelor of Computer Applications (BCA)

2022 – 2025

Relevant coursework: Data Structures, DBMS, Web Technologies, Software Engineering, Algorithms

Higher Secondary Education (HSE)

2019 – 2021
